                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                APPLICANT: HOFFILK, Vered
TITLE OF INVENTION: CONFORMATIONALLY CONSTRAINED BACKBONE CYCLIZED SOMATOSTATIN ANALC
FILE REFERENCE: 87534-3099
FILE REFERENCE: 87534-3099
CURRENT APPLICATION NUMBER: US/10/916,522A
CURRENT PILING DATE: 2004-08-12
PRIOR APPLICATION NUMBER: 09/734,583
PRIOR FILING DATE: 2000-12-13
NUMBER OF SEQ ID NOS: 10
SOFTWARE: PATENTIN VERSION 3.1
SEQ ID NO 4
LENGTH: 8
                                                         NAME/KEY: PREPTIDE

LOCATION: (1)..(8)

OTHER INFORMATION: (residue 4) is D-Trp. Lys (residue 5) is N-Fmoc-Lys or N-Fms-Lys.
OTHER INFORMATION: Thr (residue 8) is Thr-O-acetate.
PEATURE:
NAME/KEY: DISULFID

LOCATION: (2)..(7)

COTHER INFORMATION: Disulfide bond between the two Cys amino acid groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LOCATION: (2)..(2)
OTHER INFORMATION: A disulfide bridge is formed between Cys residues 2 and 7

US-10-566-223-22

Sequence 22, Application US/10506223

Sequence 22, Application US/10506223

Eublication No. US2066009622A1

GENERAL INFORMATION:

APPLICANT: PUBGLIEr, Joseph A.

TITLE OF INVENTION: Conjugates of Therapeutic or Cytotoxic

TITLE OF INVENTION: Agents and Biologically Active Peptides

FILE REFERENCE: 07005/007002

CURRENT APPLICATION NUMBER: US/10/506,223

CURRENT FILING DATE: 2004-08-31

FRIOR FILING DATE: 2003-03-03

PRIOR FILING DATE: 2002-03-03

PRIOR FILING DATE: 2002-03-01

NUMBER OF SEQ ID NOS: 40

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 22

LENGTH: 13

TYDE: DETAIL 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     OTHER INFORMATION: Synthetic

```
The present sequence is that of a synthetic somatostatin analogue. The peptide can be used as component B in a claimed composition comprising a somatostatin analogue of formula (A-B), where A is Cys, or a peptide chain comprising one or more Cys residues, which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring to a drug or chelator via a thiol linkage. The drug is a naturally occurring comatostatin receptor (SSTR). The drug or chelator is bound to the Cys residue(s) of component A by a thiol linkage. The drug is a therapeutic cfrug such as a radioisotope, a cytotoxin, an immunostimulant, an antiangiogenic agent a therapeutic gent, or a chemotherapeutic agent.

The somatostatin analogue preferably binds to SSTR-positive cells, especially human cancer cells A claimed method for detecting SSTR.

CC detectable label is bound to the Cys residue(s) of component A, and detecting the label. A claimed method for treating an SSTR-associated disorder is bound to the Cys residue(s) of component A. The SSTR associated disorder is sepecially cancer. Thiol-mediated drug attachment as a lso be used with other targeting peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Somatostatin, acromegaly, radiolocalisation; blood-brain barrier; cancer;

                                                                                                                    The invention provides for conventional somatostatin analogues (AAM48638-W48640 and Multi-tyrosinated analogues (AAM48641-W48645) was the present one. The multi-tyrosinated somatostatin analogues bind to somatostatin receptors with practically the same affinity as native somatostatin. The somatostatin analogues are claimed to be useful for for treating disease associated with increased production of factors which can be regulated by somatostatin, e.g. acromegaly. Also when radioactively labelled, the analogues are claimed to be useful for diagnosing cancer in vitro or in situ where aberrant expression of somatostatin receptors is involved. When halogenated, these analogues are found to bind somatostatin receptors with such high affinity that binding is nearly irreversible under physiological conditions. Therefore, by using radioactive halogenated analogues, the invention claims for improved sensitivity of radiolocalisation of the receptors: Multi-tyrosinated analogues have increased half-lives in vivo relative to
                                                                                                                                                                                                                                                                                                                                                                           ô

                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of treating retinopathy of prematurity in a neonatal mammal. The condition is treated or prevented by administering to the mammal a somatostatin analogue. Also described is a pharmaceutical composition Woc-4D and carrier for treating or preventing retinopathy of prematurity in neonatal mammal. The somatostatin analogue is octreotide, Woc4D, somatostatin analogue having serum half-life of octreotide, somatostatin analogue having serum half-life of octreotide, or somatostatin analogue having serum half-life of woc-4D. It is selected from octreotide, lanreotide, vapreotide, Woc-2B, Woc-3B, Woc-3B, Woc-3B, Woc-3B, Woc-4D, Woc-5, or Woc-8. The invention provides a therapeutic benefit without affecting growth of the neonates. The present sequence represents somatostatin analogue, Woc-4D.
                                                                                                                                                                                                                     mammal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                 Treatment or prevention of retinopathy of prematurity in neonatal me comprises administering somatostatin analog having composition that provides therapeutic benefit to mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; dispersed phase formulation; microsphere;

The invention provides for conventional somatostatin analogues (AAW48638-W48640 and AAW48644) and multi-tyrosinated analogues (AAW48645) such as the present one. The multi-tyrosinated somatostatin analogues bind to somatostatin receptors with practically the same affinity as the present one. The somatostatin analogues are claimed to be useful for reating disease associated with increased production of factors which can be regulated by somatostatin, e.g. acromegaly. Also when the requisated by somatostatin, e.g. acromegaly. Also when caloactively labelled, the analogues are claimed to be useful for disgnosting cancer in vitro or in situ where aberrant expression of somatostatin receptors is involved. When halogenated, these analogues are found to bind somatostatin receptors with such high affinity that binding is nearly irreversible under physiological conditions. Therefore, by using radioactive halogenated analogues, the invention claims for using radioactive halogenated analogues, the invention claims for throsinated analogues have increased half-lives in vivo relative to conventional somatostatin analogues, are resistent to enzymatic degradation and have increased blood-brain barrier penetration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Monatostatin-dopamine chimeric analogue; cytostatic; antithyroid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                          The specification describes a dispersed phase formulation which comprises a biocompatible and biodegradable polymer, at least one nucleophilic substance capable of catalyzing ester bond cleavage and causing molecular weight reduction of the polymer, and scid additive in an amount such that the polymer is less susceptible to molecular reduction as compared to the formulation without the acid additive. The formulation of the invention is useful for preparing microspheres providing a sustained or controlled release of drug. This is useful for suppressing gonadotropin releasing hormmone in the treatment of testosterone dependent disorder, benign prostate hypertrophy or prostate cancer. methyl-carbanic acid. Optionally bound to carbonic acid
mono-(7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-
fg]quinolin-9-yl-methyl) ester. Optionally bound to 4-((7-
propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-
fg]quinolin-9-yl-methyl) carbomyl butyric acid.
Optionally bound to 7-propyl-4,6,6a,7,8,9,10,10a-
octahydroindolo[4,3-fg]quinolin-9-carboxylic acid.
Optionally bound to 3-(1-(7-ally1-4,6,6a,7,8,9,10,10a-
octahydroindolo[4,3-fg]quinolin-9-carbonyl)-3-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidarkhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antibacterial, immunomodulator, hypertensive, irranquiliser, antilipaemic, nephrotropic, antiulcer, antiarthritic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorestal, hypotensides, extensial, hypotensial, economis, testenosis, cromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal
GH secreting adenoma; acromegally, TSH secreting adenoma; prolactin secreting adenoma; insulinoma; glucagonoma; diabetes mellitus; prolactin secreting adenoma; insulin insensitivity; Syndrome X; anglopathy; proliferative retinopathy; dawn phenomenon; nephropathy; gastric acid secretion; peptic ulcer; enterocutaneous fistula; pancreaticocutaneous fistula; dumping syndrome; watery diarrhoea syndrome; pancreatitis; gastrointestinal hormone secreting tumour; angiogenesis; arthritis; allograft rejection; graft vessel bleeding; portal hypertension; gastrointestinal bleeding; obesity; opioid overdose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New somatostatin-dopamine chimeric analogs useful for the treatment of

that comprise at least one moiety that binds to one or more somatostatin receptors and at least one moiety that binds to one or more dopamine receptors, or a salt derived thereof. Specifically, it refers to analogues that may be used in vitro or in vivo for research, diagnostic and therapeutic agents to enhance the activity of somatostatin and dopamine i.e. working as receptor agonists. The present invention can therefore analogues with specificity for different types of somatostatin receptor subtypes that are accordingly associated with the treatment of particular diseases or conditions. As such, these analogues may be used to treat neoplasis and acromegaly as well as various neuroendocrine turner diseases or conditions. As such, these analogues may be used to treat neoplasis and acromegaly as well as various neuroendocrine tumours, vascular diseases e.g. rheumatoid arthritis, gastrointestinal sclared diseases e.g. sclaredderma, immune diseases e.g. rheumatoid arthritis, gastrointestinal clasorder or an opicid overdose. Accordingly, they exhibit activities that include cytostatic, osteopethic, antithyroid, vasctropic, antiangingenic, ophthalmological, antidiabetic, antinflammatory, antiulcer, antiangingenic, antianginal, anorectic, immunomodulator, candant, tranquillizer and antiaddictive. This peptide sequence is a somatostatin-dopamine chimeric analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              somatostatin-dopamine chimeric analogue; cytostatic; antithyroid;

Myothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; myothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; myothyroidism; hyperaldosteronism; Helicobacter pylori proliferation; macromegaly; restenosis; Cronn's disease; systemic sclerosis; pancreatic pseudocyst; ascite; Vloma; nesidoblastosis; hyperingulinism; myothyroididism; sclated diarrhoea; chemotherapy related diarrhoea; scleroderma; miritable bowel syndrome; pancreatitis; small bowel obstruction; gastroesophageal reflux; duodenogastric reflux; Cushing's syndrome; diabetic neuropathy; paget's disease; polycystic ovary disease; thyroid cancer; heperparathyroidism; Graves disease; thyroid cancer; heperparathyroidism; meningioma; cancer cachexia; orthorestatic; hypotenaion; postprandial hypotension; panic attack; prolactin secreting adenoma; leukaemia; meningioma; denoma; diabetes mellitus; myolactin secreting adenoma; neullinoma; glucagonoma; diabetes mellitus; myolactin secreting adenoma; insulininoma; glucagonoma; diabetes mellitus; myorliferative retinopathy; dawn phenomenon; nephropathy; gastric acid secretion; peptic ulcer; enterocutaneous fistula; dumping syndrome; This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidarthoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, nephrotropic, antiulcer, antiarthritic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, New somatostatin-dopamine chimeric analogs useful for the treatment of /note= "Amino acid is Doc. Bound to 1-(7-allyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-carbonyl)-3-ethylureidomethylsulfanyl acetic acid" /note= "Residue forms a bond to residue 5 to form a cyclic peptide" watery diarrhoea syndrome; pancreatitis; gastrointestinal hormone secreting tumour; angiogenesis; arthritis; allograft rejection; graft vessel bleeding; portal hypertension; gastrointestinal bleeding; obesity; opioid overdose. /note= "Residue forms a bond to residue 10 to form cyclic peptide" hypotensive; anorectic; antiaddictive; dopamine receptor agonist; (SCRC ) SCRAS SOC CONSEILS RECH & APPL SCI. /note= "C-terminal amide" Moreau J; note= "D-form residue" note= "D-form residue" Location/Qualifiers Claim 3; Page 144; 85pp; English. This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidarhoeic, anti-inflammatory, antidarhoeic, antidiulcer, antidarthoeic, antidiulcer, antidarthoeic, antidiulcer, antidarthoeic, antidiulcer, antidarthoeic, antidiulcer, antidarthic, hypotensive, anorectic or antidactive activity through action as a dopamine receptor agonist and series and action as a dopamine receptor agonist and treatment of lung ancer, glioma, anorexia, hypothyroidism, treatment of lung ancer, glioma, morexia, hypothyroidism, threatment of lung ancer, glioma, anorexia, hypothyroidism, threatment of lung ancer, glioma, anorexia, hypothyroidism, crostenosis, Compacteronism, Helicobacter pylori proliferation, gastrinoma, 2011mogr-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable pancreatic pseudocysts and sacites, Vipoma, mesidoblastosis, orelated diarrhoea, chemotherapy related diarrhoea, sclerosophageal refulux, duodenogastric reflux, cubing's syndrome, gonadcrophageal ceflux, duodenogastric reflux, cubing's syndrome, gonadcrophageal ceflux, duodenogastric reflux, cubing's syndrome, gonadcrophageal ceflux, duodenogastric reclux, dushing's syndrome, ancer cachexia, orthostatic, hypotension, postprandial ceflux, duppermannent, and abeces mellitus, hypotension, postprandial cecreting adenomas, prolactin secreting adenomas, insulinoma, dabeces mellitus, hypotension, dash phenomenon, diabeces mellitus, dameromannens, insulinoma, sarromegally, syndrome, yastride acceptor agonist rejection, graft vessel bleeding, cortal hypotrension, gastrointestinal bleeding, obesity and opioid overadose. The compounds similareously elicit dopamine receptor agonist centose the native somatostatin acceptor agonist that of a peptide which was used to
                                                                                                              /note= "Amino acid is Doc. Bound to 7-propyl-
4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinolin-9-yl-
methylsulfanyl-acetic acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New somatostatin-dopamine chimeric analogs useful for the treatment of
                                                                                                                                                                                                                                                                                                                                /note= "Residue forms a bond to residue 5 to form a
cyclic peptide"
                                                                                                                                                                                                                          /note= "Residue forms a bond to residue 10 to form cyclic peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (SCRC ) SCRAS SOC CONSEILS RECH & APPL SCI.

This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarchoeic, anti-inflammatory, compounds with a cytostatic, antidiabetic, osteopathic, antidiarchoeic, antidiatric, inportantiable antidiarchoeic, antidiatory, antidiatory, antidipaemic, compounds antidictive activity through action as a dopamine receptor agonist antidiatory activity through action as a dopamine receptor agonist antidiatory and activity through action as a dopamine receptor agonist the somatostatin receptor agonist. The invention may be useful for the somatostatin receptor agonist. The invention may be useful for the sentences, crowded and active solicity proliferation, acromegaly, byperaldosteronism, Helicobacter pylori proliferation, acromegaly, restanced control and sected solicity actomes, and active solicity selections, callonger-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, achemocherapy related diarrhoea, pancreatitis, amil bowel obstruction, gastropinoma, chowel syndrome, pancreatitis, and secreting adenomas, insulinoma, leukaemia, insulinoma, cholycystic ovary disease, thyroid cancer, hepatoma, pancreatication actedia, orthostatic, hypotension, pantro activity, dawn phenomenous fistula, pancreatical, activity, dawn phenomenous fistula, pancreatical, activity, dawn phenomenous fistula, pancreatics, arthritis, allograft rejection, graft vessel bleeding, partorinegenesis, arthritis, allograft rejection, graft vessel bleeding, corrdose. The compounds simultaneously elicit dopamine activity, over the native somatos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

antiadictive activity through action as a dopamine receptor antiadictive activity through action as a dopamine receptor agonist and antiadictive activity through action as a dopamine receptor agonist and conatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, gliome, ancertain, hypothyroidism, hyperaldosteronism, Helicobacter pylori proliferation, acromegaly, ceferosis, ceferosis, estendiosis, crown's disease, systemic sclerosis, estendiosis, crown's disease, systemic sclerosis, estandiosis, chomed pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, byperinsulinism, gastrinoma, 20linger-Blison Syndrome, diarrhoea, AIDS celated diarrhoea, hemotherapy related diarrhoea, diarrhoea, celated diarrhoea, disease, disease, diabetic neuropathy, gastrocosophageal cellux, duodenogastric reflux, Cushing's syndrome, gonadotropinoma, hyperparathyroidism, Garves disease, thyroid cancer, hepatoma, leukaemia, cancer cachexia, orthostatic, hypotension, postprandial celasos, panic attacks, GH secreting adenomas, and panic attacks, GH secreting adenomas, insulinoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, collucagonoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, collucagonoma, diabetes mellitus, dumping syndrome, watery diarrhoea fistula, pancreaticocutaneous fistula, dumping syndrome, watery diarrhoea (istula, pancreatitis, allograft rejection, graft vessel bleeding, correcting adenomas activitis, allograft rejection, correcting consensity and oppoid correcting consensity and oppoid correcting consensity and oppoid correcting consensity and oppoid correcting correcting consensity and oppoid correction, compounded simultaneously elicit dopamine receptor agonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
antibacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

peptide can be used as component B in a claimed composition comprising somatostatin analogue of formula (A-B), where A is Cy8, or a peptide can be used as component B in a claimed composition comprising one or more Cy8 residues, which is suitable for binding to a drug or chelator via a thiol linkage, and B is a naturally occurring or synthetic somatostatin peptide, or its fragment, that binds to the Cy8 residue(B) of component A by a thiol linkage. The drug is a therapeutic cantianglogenic agent, a therapeutic gene, or a chemotherapeutic agent. The somatostatin rappeutic gene, or a chemotherapeutic agent. The somatostatin analogue preferably binds to SSTR-positive cells. A claimed method for detecting SSTR-comprises administering the somatostatin analogue in which a detectable label is bound to the Cy8 residue(B) of component A, and claimed method for treating an SSTR-associated disorder comprises administering a somatostatin analogue in which a therapeutic agent is bound to the Cy8 residue(B) of component A. The SSTR cassociated disorder is especially cancer. Thiol-mediated drug attachment can also be used with other targeting peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                        A composition comprising a somatostatin analog useful for thiol-specific drug attachment to somatostatin and other targeting peptides, or for diagnosing or treating somatostatin receptor-associated disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         somatostatin-dopamine chimeric analogue; agonist; cyclic; vascular disease; angiogenesis; connective disease; scleroderma; immune disease; rheumatold arthritis; gastrointestinal tract disorder; irritable bowel syndrome; metabolic disease; hyperlipidaemia; cachexia; cancer; musculoskeletal disorder; panic disorder; opioid overdose; cytostatic; osteopathic; antithyroid; vasotropic; antiangiogenic; ophibalmological; antidiabetic; dermatological; immunosuppressive; antiarthritic; antirheumatic; antilnflammatory; antilloer; antidagatholic; nephrotropic; antilipeamic; analgesic; antianginal; anorectic; immunomodulator; cardiant; tranquillzer; antiaddictive; acromegaly; neoplasia; neuroendocrine tumour.

This invention relates to novel somatostatin-dopamine chimeric analogues
that comprise at least one moiety that binds to one or more dopamine
creceptors and at least one moiety that binds to one or more dopamine
receptors and at least one moiety that binds to one or more dopamine
creceptors or a salt derived thereof. Specifically, it refers to
analogues that may be used in vitro or in vivo for research, diagnostic
and therapeutic agents to enhance the activity of somatostatin and
describes analogues with specificity for different types of somatostatin
creceptor subtypes that are accordingly associated with the treatment of
particular diseases or conditions. As such, these analogues may be used
to treat neoplasia and acromegaly as well as various neurcendocrine
to particular diseases e.g. rheumatoid arthritis, gastrointestinal
tract disorders e.g. irritable bowel syndrome, metabolic diseases e.g.
cract disorders e.g. irritable bowel syndrome, metabolic diseases e.g.
hyperlipidaemia, cachexia, cancer, a musculoskeletal disorder, panic
disorder or an opicid overdose. Accordingly, they exhibit activities that
include cytostatic, osteopathic, antithyroid, vasotropic, antiangiogenic,
ophthalmological, antidiabetic, dentantosical, immunosuppressive,
antiarthritic, antirheumatic, antiinflammatory, antiulcer,
antiandinal, anorectic, immunomodulator, cardiant, tranquillizer and
antiandictive. This peptide sequence is a somatostatin-dopamine chimeric
containing analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric analog comprising at least one moiety which binds to one or more sometostatin and dopamine receptor(s) useful to treat e.g. neuroendocrine tumor, vascular diseases, connective tissue disease, immune disease and cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyvoid, vasotropic, anti-inilammatory, antidarchoeic, antidiler, antidiler, antidiabetic, osteopathic, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, antidiler, and opposite where the antidiler, and opposite when the nation receptor agonist enough some the nation receptor agonist enough some the nation of the present in antidiler, and opposite which was antidiler, and opposite and somatostatin receptor agonist effects in vivo with enhanced antidiler, the sematostatin and dopamine antidiler, and opposite the compounds simultaneously elicit dopamine of the present elicit.
                                                                                                                                                                                                                                                                                                                                                    New somatostatin-dopamine chimeric analogs useful for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            produce the somatostatin-dopamine chimeric analogues of the invention.

compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidarrheeic, anti-HTV dermatological, anti-inflammatory, antidarrheeic, anti-HTV dermatological, anti-diabetic, onterpreted antidarrheeic, antidacterial, immunomodulator, hypertensive, tranquiliser, antilipaemic, nephrotropic, antidiocer, antiatrhitic, hypotensive, anorectic or antiaddictive activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, gloma, anorexia, hypothyroidism, hypotensive, acromegaly, hypotensis, crohn's disease, systemic sclerosis, external and internal parcratic pseudocysts and ascites, VIPoma, nesidoblastosis, hyperatinsulinism, gastrinoma, 20linger-Ellison Syndrome, darrhoea, chemotherapy ralated diarrhoea, scleroderma irritable parcrainsulinism, gastrinoma, 20linger-Ellison Syndrome, darrhoea, chemotherapy ralated diarrhoea, scleroderma irritable bowel syndrome, pancreatitis, small bowel obstruction, gastroesophageal reflux, duodenogastic reflux, Cubings, syndrome, pancreatic covary disease, thyroid cancer, hepatoma, leukaemia, hyperparathyroidism, cancer achexia, orthostatic, hypotension, postprandial hypotension, panic achexia, orthostatic, hypotension, postprandial hypotension, panic achexia, orthostatic, hypotension, panic achexia, orthostatic, panic achexia, darknomes, acromegally, TSH secreting adenomas, prolactin secreting adenomas, insulinome, watery diarrhoea spindrome, yastroineses melliture, hypotension, panic achexia, orthostative retinopathy, dawn phenomenous fistula, dumping syndrome, watery diarrhoea syndrome, pancraticicottaneous fistula, dumping syndrome, pancraticicottaneous fistula, dumping syndrome, and operated in receptor agonist effects in vivo with enhanced cortain cortain dopamine analogues and somatostatin receptor agonist effects in vivo with enhanced cortain cortain cortain contexts, and open cortain which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           wasotropic; anti-inflammatory, antidiarrhoeic; antithyroid;

New somatostatin-dopamine chimeric analogs useful for the treatment of

e.g. lung cancer.

```
cr thair singention relates to movel someosetatin-copeanine chiments and accordant on relates to movel someosetatin-copeanine chiments and compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarnheeic, anti-HTV, dermarcological, anti-diabetic, osteopathic, antidiarnheeic, anti-HTV, dermarcological, anti-diabetic, osteopathic, antidiapemic, antidiactive activity through action as a dopamine receptor agonist and activity through action as a dopamine receptor agonist antidadictive activity through action as a dopamine receptor agonist antidadictive activity through action as a dopamine receptor agonist antidadictive activity through action as a dopamine receptor agonist antidadictive activity through action as a moreatic many be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidien for the treatment of lung cancer, glioma, anorexia, hypothyroidien, acromegaly, restenced to pseudocysts and ascites, VIPoma, nesidoblastosia, hypotinensial pancreatic pseudocysts and ascites, VIPoma, nesidoblastosia, irritable conforme, pancreaticis, small bowel obstruction, gastrosesphageal crelux, duodenogastric reflux, Cushing's syndrome, galarhoea, AIDS related diarrhoea, scherosesphages conformed gastric reflux, Cushing's syndrome, gonadotropinoma, disease, polycystic ovary disease, thyroid cancer, hepatom, leukaemia, disease, polycystic ovary disease, thyroid cancer, hepatom, cancer cachexia, orthostatic, hypotension, postprandial catering adenomas, adiabetes mellitus, hyperlipidaemia, insulinoma, secreting adenomas, prolactin secreting adenomas, actomedally, gastric acides secreting adenomas, insulinoma, concerted secreting asseroment, and paperdy ypolicestin secreting adenomas, adiabetes mellitus, hyperlipidaemia, insulinoma, adiabetes mellitus, hyperlipidaemia, insulinoma, companion, gastrointestinal hormone secreting though the pancreatics, gastrointestinal hormone secreting adenomas, adiabetes mellitus, duodenogastain receptor agonist effects in vivo with enhanced coverdose. The 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                somatostatin-dopamine chimeric analogue; cytostatic; antithyroid; vasotropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; anti-dibetic; osteopathic; antidacterial; immunomodulator; hypertensive; tranquiliser; antialipaemic; nephrotropic; antiulcer; antiarthritic; hypotensive; anorectic; antiaddictive; dopamine receptor agonist; hypotensive; anorectic; antiaddictive; dopamine receptor agonist; hypotensine; hypotensine; hypotensine; hypotensine; hypotensine; lang cancer; glioma; anorexia; hypotensine; hypotensine; crohn's disease; systemic sclerosis; proliferation; acromegaly; restenosis; Crohn's disease; systemic sclerosis; hyperinsulinism; gastrinoma; Zollinger-Blison Syndrome; diarrhoea; scleroderma;
                                                  This invention relates to novel somatostatin-dopamine chimeric analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    initeable bowel syndrome; pancreatitis; small bowel obstruction; gastroesophageal reflux; duodenogastric reflux; Cushing's syndrome; gonadotropinoma; hyperparathyroidism; Graves disease; diabetic neuropathy; Paget's disease; polycystic ovary disease; thyroid cancer; hepatoma; leukaemis; meningioma; cancer cachexia;

or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-inflammatory, antidiarhoeic, anti-IV, dematological, anti-diabetic, osteopathic, antidiarhoeic, antidiarhoeic, antidiarhoeic, antidiared compounds with a cytostatic, antidiated, immunomodulator, hypertensive, tranquiliser, antidipaemic, nephrotropic, antidictive activity through action as a dopamine receptor agonist and sometostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, acromegaly, restandseseronism, Halicobacter pylori proliferation, acromegaly, restandsis, Crohn's disease, systemic sclerosis, external and internal pancreatic pseudocysts and ascites, VIPoma, nesidoblastosis, whysinsulinism, gastrinoma, Zollinger-Ellison Syndrome, diarrhoea, Alds chemotherapy related diarrhoea, scleroderma, irritable bowel syndrome, pancreatitis, small bowel obstruction, gastroseophageal cellus, dudenogastric reflux, Cushing's syndrome, gonadotrophoma, chyperparathyroidism, draves disease, thyroid cancer, hepatoma, leukaemia, meningloma, cancer cachexia, orthostatic, hypotension, postprandial
                                                                                                                                                                                                                                                                                                                                         /note= "Amino acid is Doc. hypotension, panic attacks, GH secreting adenomas, acromegally, TSH secreting adenomas, prolactin secreting adenomas, insulinoma, glucagonoma, diabetes mellitus, hyperlipidaemia, insulin insensitivity, syndrogene, angiopathy, proliferative retinopathy, dawn phenomenon, nephropathy, gastric acid secretion, peptic ulcer, enterocutaneous fistula, dumping syndrome, watery diarrhoea syndrome, pancreatifis, gastrointestinal hormone secreting tumour, portal hypertension, gastrointestinal hormone secreting tumour, portal hypertension, gastrointestinal bleeding, obseity and opioid overdose. The compounds simultaneously elicit dopamine receptor agonist and somatostatin receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           note= "D-form residue, optional tert-butyl modification"

Claim 3; Page 133; 85pp; English.
       Life an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and cumours of neuroendocrine origin (for e.g. carcinoid syndrome), and created are inflammatory bowel disease, autoimmuse disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and acromegaly. Peptide JF-08-87A has the ability to inhibit growth hormone or clease from primary cultures of rat pituitary cells, having an ICSO of colls on the sequence is identified as SEQ ID 2 in the disclosure (page 16), but it is not the same as the sequence given as SEQ ID 2 in the equence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  somatostatin-dopamine chimeric analogue; cytostatic; antithyroid; vasotropic; anti-inflammatory; antidiarrhoeic; anti-HIV; dermatological; anti-diabelic; osteopathic; antibacterial; immunomodulator; hypertensive; tranquiliser; antilipaemic; neptrotropic; antiulcer; antiarthritic; hypotensive; anorectic; antiaddictive; dopamine receptor agonist; somatostatin receptor agonist; lung cancer; glioma; anorexia; hypothyroidism; hyperaldosteronism; Helicobacter pylori proliferation;
                                                                                                                                                                                                                                               Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of anglogenic blood
                                                                                                                                                                                                                                                                                                                                   The present sequence is that of somatostatin analogue peptide JF-08-87A.

```
This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasotropic, anti-liflammatory, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidiactoric antidatoric antidatory, antidatoric antidatory, antidatoric antidatory, antidatory antidatory, antidatory, antidatory antidatory, antidatory, antidatory antidatory, antidatory antidatory, antidatory and antidatory antidatory and antidatory and antidatory antidatory antidatory and antidatory antidatory and antidatory and antidatory antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory and antidatory 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "DOTA moiety or optional DOTA-O-benzyl or O-benzyl modification, D-form residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and somatostatin receptor agonist effects in vivo with enhanced biological activity over the native somatostatin and dopamine analogues alone. The present sequence is that of a peptide which was used to produce the somatostatin-dopamine chimeric analogues of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     'note= "optionally modified with D-O-benzyl, D-form

The present sequence is that of a peptide analogue conjugate that is an actample of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelathing group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammatory bowel disease, autoimmune disorders, rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood

                                                                                                                                                                                                                                                                                                                       The present sequence is that of a somatostatin analogue peptide. It is an example of peptide agents of the invention that comprise a biologically active peptide, such as somatostatin or bombesin, conjugated to a chemical compound through a linker that maintains the peptide's biological activity. The peptide agents may also include a cytostatic or therapeutic agent, label or chelating group and a peptide that increases the hydrophilic biodistribution of the agent. They are useful for treating tumours of the lung, breast, brain, eye, prostate, or colon, tumours of neuroendocrine origin (for e.g. carcinoid syndrome), and angiogenic blood vessels (claimed). Other diseases that can also be treated are inflammantory bowel disease, autoimmune disorders, rheumatoid arthritis, neoplastic cells or aberrantly proliferating cells, and arthritis, neoplastic cells or aberrantly proliferating cells, and cromegaly. The present peptide has the ability to inhibit growth hormone release from primary cultures of rat pituitary cells, having an ICSO of 0.24 nM (compared with 0.15 nM for somatostatin-14)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
Biologically active peptides such as somatostatin or bombesin conjugated to chemical compounds through linkers, useful for treating tumors of the lung and breast, carcinoid syndrome, and tumors of angiogenic blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Somatostatin-dopamine chimeric analogue-related peptide 47.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 80.0%; Score 64; DB 6; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel somatostatin-dopamine chimeric analogues or their salts. The invention may be useful for the development of compounds with a cytostatic, antithyroid, vasctropic, anti-inflammatory, antidarrhoeic, anti-HIV, dermatological, anti-diabetic, osteopathic, antidarcerial, immunomodulator, hypetensive, tranquiliser, antilipaemic, nephrotropic, antiulcer, antiarthritic, hypotensive, anorectic or nephrotropic, activity through action as a dopamine receptor agonist and somatostatin receptor agonist. The invention may be useful for the treatment of lung cancer, glioma, anorexia, hypothyroidism, cromegaly, restenosis, Crohn's disease, systemic sclerosis, external and internal parcreatic pseudocysts and ascites VIPoma, nesidoblastosis, hyperinaulinism, gastrinoma, zollinger-Ellison Syndrome, diarrhoea, AIDS related diarrhoea, chemotherapy related diarrhoea, scleroderma, irritable bowel syndrome, pancreatitis, small bowel obstruction, gastroseophageal reflux, cushing's syndrome, gonadotropinoma, hyperparathyroidism, Garves disease, diabetic neuropathy, Paget's disease, polycystic ovary disease, thyroid cancer, hepatoma, leukaemia, meningioma, cancer cachexia, orthosexatic, hypotension, panic attacks, GH secreting adenomas, acromegally, TSH hypotension, panic attacks, GH secreting adenomas, acromegally, TSH
